# IPv6 Allocations

Many IPv6 address holders appear to want to avoid being “caught short” with IPv6, and have received IPv6 address allocations that are far larger than their current needs for public IPv6 addresses

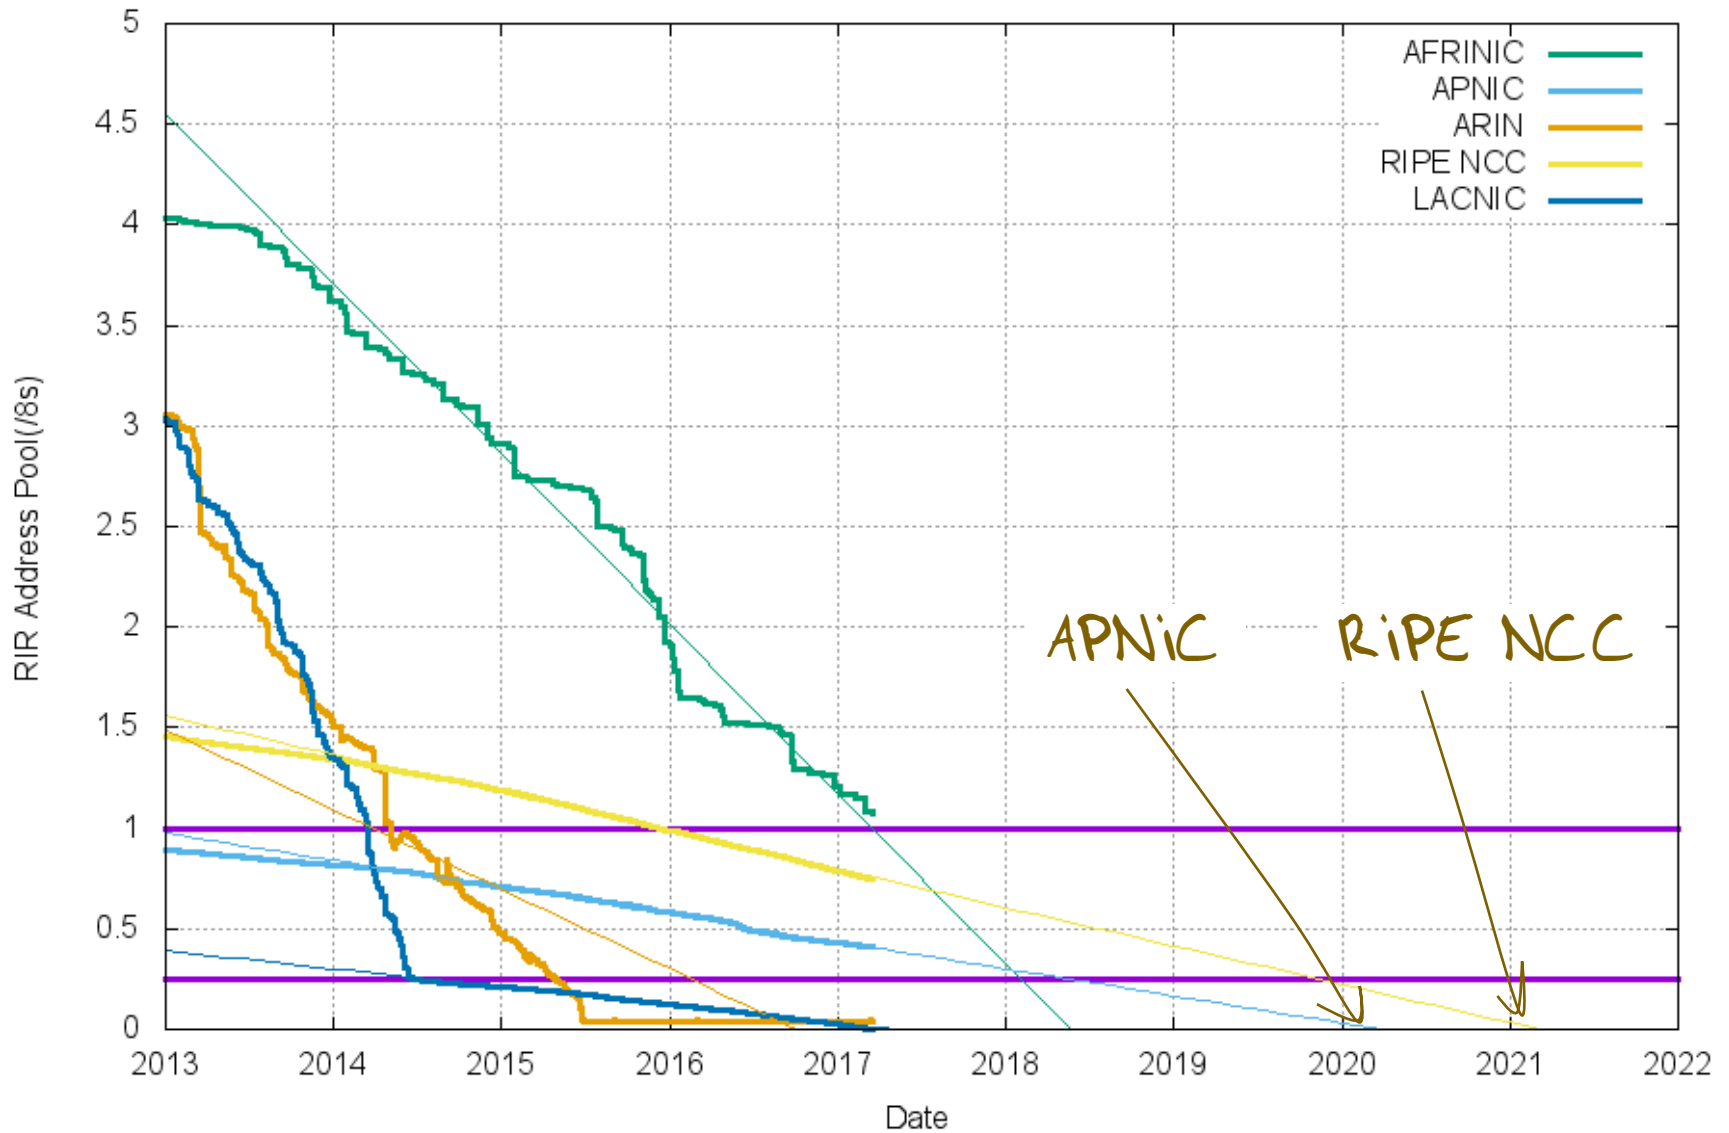

This is consistent with an overall address management framework that is not primarily driven by address conservation objectives

This, in turn, is consistent with the IPv6 design choice to use a very large address field, so that such liberal address allocation practices can be sustained for many decades

IPv4

# IPv4: Allocated vs Recovered in 2016

IPv4 Address Pools: 2016 - 2017

# The IPv4 After-Market: Address Transfers

- There is a considerable residual demand for IPv4 addresses following exhaustion
  - IPv6 is not a direct substitute for the lack of IPv4
- Some of this demand is pushed into using middleware that imposes address sharing (Carrier Grade NATS, Virtual Hosting, etc)
- Where there is no substitute then we turn to the aftermarket
- Some address transfers are “sale” transactions, and they are entered into the address registries
- Some transfers take the form of “leases” where the lease holder’s details are not necessarily entered into the address registry

# Registered Address Transfers

# How old are transferred addresses?

# But

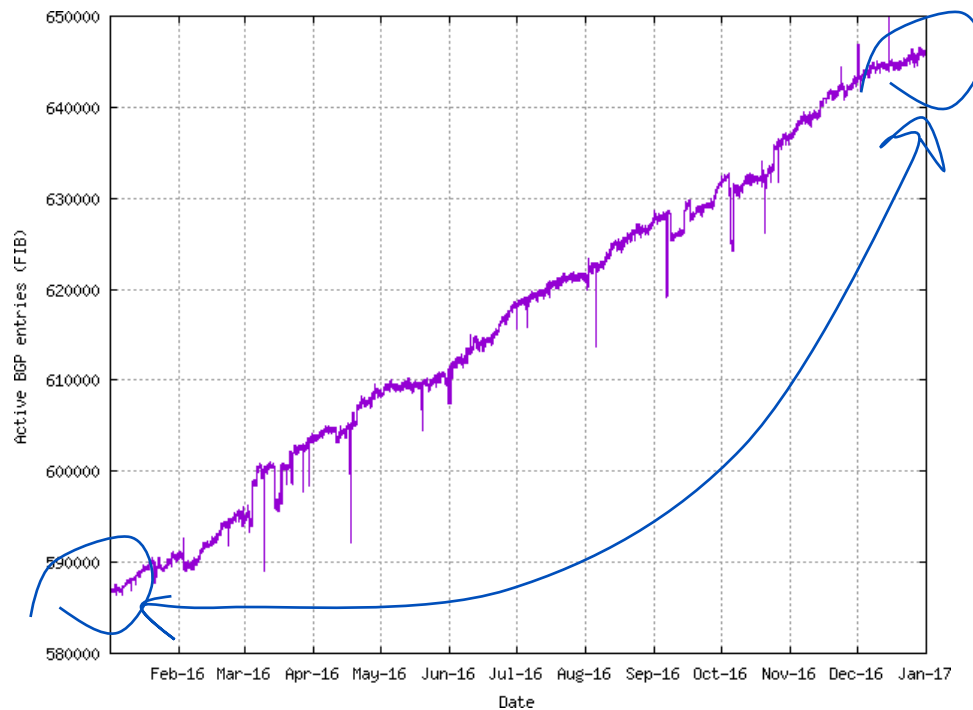

The RIR Transfer Logs are not the entire story:

- For example, the RIPE NCC's address transfer logs appear not to contain records of transfers of legacy space
- Address leases and similar “off market” address transactions are not necessarily recorded in the RIRs' transfer logs

Can BGP tell us anything about this missing data?

# A BGP View of Addresses

Lets compare a snapshot of the routing table at the start of 2016 with a snapshot taken at the end of the year.

# BGP Changes Across 2016

	Jan-16	Jan-17	Delta	Unchanged	Re-Home	Removed	Added
<b>Announcements</b>	586,918	646,059	59,141	502,846	16,928	67,504	126,645
<b>Root Prefixes</b>	286,249	309,092	22,843	252,411	10,803	22,080	46,238
<b>Address Span (/8s)</b>	156.35	158.40	2.04	147.31	2.52	5.58	8.57
<b>More Specifics</b>	300,669	336,967	36,298	250,435	6,125	45,424	80,407
<b>Address Count (/8s)</b>	51.86	56.04	4.18	47.06	0.81	4.94	8.17

What is the level of correlation between these addresses and the address ranges recorded in the transfer logs?

# BGP Changes Across 2016

	Jan-16	Jan-17	Delta	Unchanged	Re-Home	Removed	Added
<b>Announcements</b>	586,918	646,059	59,141	502,846	16,928	67,504	126,645

8,663 announcements are listed in the transfer logs

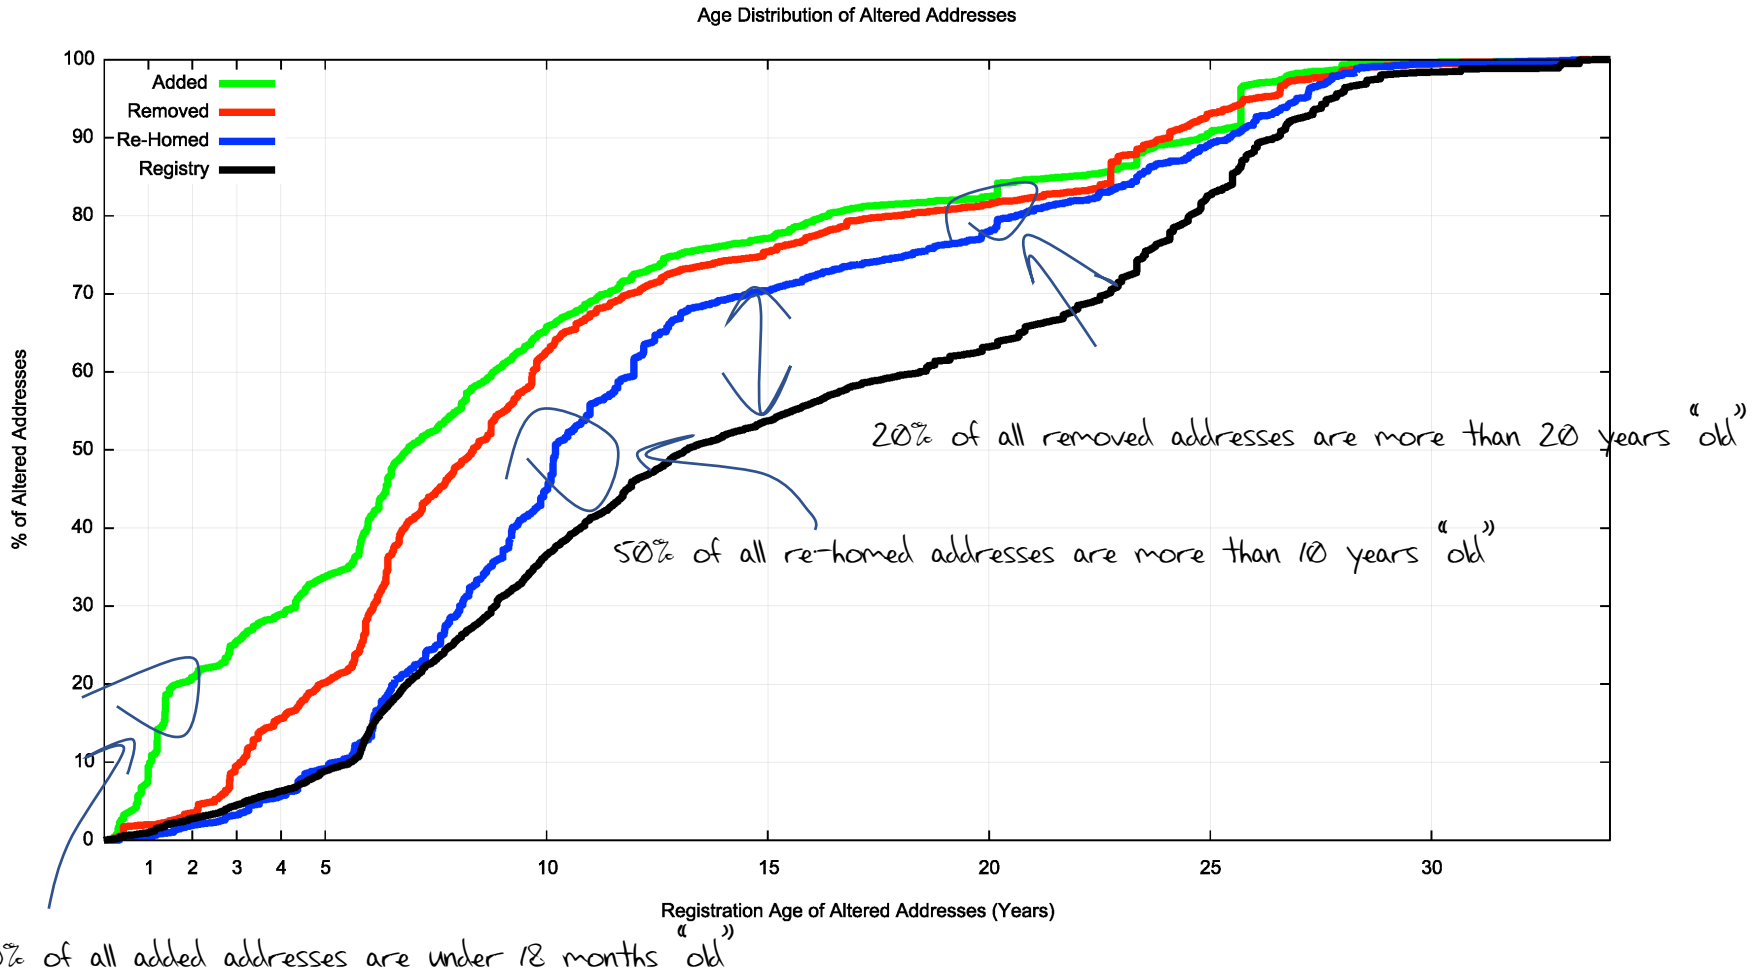

117,982 announcements are NOT listed in the transfer logs

# BGP Changes Across 2016

	Jan-16	Jan-17	Delta	Unchanged	Re-Home	Removed	Added
<b>Announcements</b>	586,918	646,059	59,141	502,846	16,928	67,504	126,645
<b>Root Prefixes</b>	286,249	309,092	22,843	252,411	10,803	22,080	46,238

		Listed as Transferred	UnListed	
<b>Rehomed</b>

<b>Removed</b>				
All	3,287	64,287		5%
Root Prefixes	1,877	20,203		9%
<b>Added</b>				
All	8,663	117,982		7%
Root Prefixes	4,617	41,621		10%

# "Age" of Shifted Addresses

20% of all added addresses are under 18 months old

# "Age" of Shifted Addresses

- Some 20% of addresses that changed their routing state in 2016 are "legacy" allocated addresses that are more than 20 years "old"
- Addresses older than 20 years look to be more stable than the registry "norm"
- Addresses allocated in the past 18 months are more likely to have been announced (naturally!)
- Addresses that are 5 – 10 years old are more likely to have been removed from the routing system in 2016

# BGP Data and Transfer Logs

- Some 5-10 % of address changes seen across 2016 (announced, withdrawn and re-homed) are listed in the RIR transfer logs
- That does **NOT** imply that the remaining 90-95% of address transfers are all unrecorded transfers
  - But it does point to a larger body of addresses that have changed their advertisement status in one way or another, some of which may have involved leasing or other forms of address movement, that are not recorded in the transfer logs

# Address Movement and the Registries

- It is not clear from this analysis what has happened in the case of the other addresses. This could include:
  - "normal" movement of edge networks between upstream providers (customer 'churn')
  - Occluded multi-homing
  - Address movement within a distributed edge network
  - Address leasing
  - Address transfers not recorded in the transfer registries
- More analysis is required to understand what is happening here

Thank You!
